WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY (SEPARATE SHEET)

PCT/IE2004/000057

Re Item V.

The following documents are referred to in this communication:

D1: US 5 005 287 A D2: US 4 373 009 A D3: WO 98/58988 A D4: WO 00/30696 A

Clarity

The application does not meet the requirements of Article 6 PCT, because claims 1,6,8,12 are not clear. The statement "at least two polymeric species of differing molecular weights" is not clear as every polymer comprises at least two polymeric species of differing molecular weights. The polymers in question have different "weight average molecular weights" and in this communication the statement "at least two polymeric species of differing molecular weights" has been understood to mean at least two polymers of differing weight average molecular weights.

Novelty

D1 discloses a hydrophilic coating, e.g. for a razor, that comprises a water-soluble polymer or copolymer of polyvinyl pyrrolidone (PVP), at least one polymerisable vinyl monomer and a photoinitiator (see D1, column 2, line 36 to column 3, line 12; column 3, line 58 to column 4, line 14; examples; claims).

D2 discloses a coating for biomedical devices, e.g catheters comprising polymers that can be produced using reactive diluents, e.g. N-vinyl pyrrolidone in the presence of benzophenone which causes the polymer to crosslink under ultraviolet light to give hydrophilic coatings (see D2, column 4, line 38-47; examples; claims).

D3 discloses a hydrophilic coating for biomedical devices comprising, e.g. PVP of two molecular weights, benzophenone, an acrylate prepolymer and a solvent (see D3, examples 7,8; claims).

D4 discloses a hydrophilic coating for biomedical devices comprising PVP which can also by UV irradiation be sterilised (see D4, page 6, line 23 to page 7, line 4; claims).

WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY (SEPARATE SHEET)

PCT/IE2004/000057

D1-D4 do not disclose a coating formulation comprising at least two polymers of different weight average molecular weights, an unsaturated hydrophilic monomer and a UV activatable compound as disclosed in independent claims 1,12. The subject-matter of claims 1,12 is therefore new in the sense of Article 33(2) PCT.

Inventive Step

The objective problem to be solved can be regarded as to provide improved hydrophilic coatings for biomedical devices which facilitates the passage of the coated device.

Document D1, which is considered to represent the most relevant state of the art, discloses a hydrophilic coating, e.g. for a razor, that comprises a water-soluble polymer or copolymer of polyvinyl pyrrolidone (PVP), at least one polymerisable vinyl monomer and a photoinitiator (see D1, column 2, line 36 to column 3, line 12; column 3, line 58 to column 4, line 14; examples; claims) from which the subject-matter of claims 1,12 differs in that the coating formulation comprises at least two (i.e. a blend of) polymers of different weight average molecular weights. The effect of having such a blend is "to optimise the hydrophilicity of the coating when wetted (cf. figure 1). The final coating on the surface of the medical device comprising an interpenetrating network has polymeric species of different lengths extending away from it which provides a means by which water may be trapped between the polymeric species when the surface is wetted. lending it hydrophilic and lubricious characteristics" (see present application, page 8, lines 1-20). It would not be obvious for a person skilled in the art from the teachings of D1 nor in combination with D2, D3 nor D4 to arrive at the solution proposed in the subject-matter of independent claims 1,12 of a coating formulation comprising at least two polymers of different weight average molecular weights, an unsaturated hydrophilic monomer and a UV activatable compound that would give rise to such an effect. Therefore, the solution proposed in the subject-matter of claims 1-14 is considered to involve an inventive step in the sense of Article 33(3).
